

Reducing our impact on the climate!

Living sustainability throughout our supply chain: This is how the **ALDI SOUTH Group** is promoting climate protection!

Since 2012, we have reduced our emissions per square metre of sales area by more than **30%** in our countries of operation.

Our 6,500 stores, logistics centres and offices are operated with **89%** green electricity.

By the end of 2024, we encourage our **strategic suppliers**, who account for 75 percent of emissions in the supply chain, to work towards setting **emission reduction targets**.

Wherever possible, we help our customers to reduce their climate impact. In some countries we offer **electric charging stations** at our stores.

Globally more than **1,800** of our stores and 37 distribution centres have **photovoltaic systems** installed on their roofs.

By 2025, we aim to reduce our operational emissions by **26%** (compared to 2016).

We are **optimising our logistics processes**, in order to reduce harmful emissions. For example, we are testing the use of electric logistics vehicles.

The future is now
We are continually modernising our stores. In around 1,600 of our stores, the refrigeration systems now run solely on CO₂.
